Project business context & problem statement	It's a well-known fact that investing in stocks and bonds can lead to significant wealth accumulation, even though the market comes with its ups and downs. Many of the world's wealthy individuals have built their fortunes through smart investments.		
	Black Guard has a strong track record in managing assets to help clients grow their wealth over time. However, the majority of Black Guard's clients have traditionally been older individuals nearing retirement with substantial savings. The company hasn't yet tapped into the potential of younger professionals and the broader public who could benefit from starting their investment journey early.		
	Our project aims to change that. By showcasing the power of early and consistent investing, we intend to attract a younger and more diverse clientele to Black Guard. Through a thorough analysis of stock and bond performance data, combined with demographic insights, we will highlight the significant difference in wealth accumulation between those who rely solely on their salaries and those who strategically plan their retirement with clear investment goals. This approach will make the benefits of early investing more relatable and compelling, encouraging more people to take charge of their financial future with Black Guard.		
Business objectives	Highlight the benefits of early investing to attract younger clients to Black Guard by comparing the long-term growth of investments versus traditional savings through data-driven insights for informed financial decisions.		

Section	Content
Data mining goals	Describe the general demographics of working people for potential customer segmentation. • Compare and contrast the demographics and financial awareness of the working population across the globe. • Segment customers based on the median salary, expenses, etc. to advise realistic retirement goals. Analyze investment returns to support the exponential wealth growth over time. • Analyze the overall trends of stocks and bonds to identify which markets offer the highest returns. • Build cointegration models to identify which stocks or companies affect the overall market performance. Identify correlations between investment returns and news breakout to determine the best and worst scenarios for public risk awareness. • Understand the correlation between the values of those companies and news and social media sentiment. • Potentially evaluate the stock price of a company based on news breakout. Analyze the time series of wealth accumulation of a working person with and without financial knowledge. Challenging Goals [may or may not be able to do] • <u>Diagnose the underlying factors that may influence the stocks and bonds trends.</u> • <u>Develop predictive models to forecast future prices based on current news outbreaks.</u> • <u>Develop dynamic trading strategies to beat the market and maximize profit for clients.</u> • <u>Prescribe risk mitigation plans for worst-case scenarios to minimize the loss.</u>
Data Source	S&P500 Stocks Gold Prices Consumer Price Index BBC News NYT Articles Global Salary Data Salary by Job Title & Country Twitter Financial News Stock Tweets <i>These are all usable datasets from which we will pick a few after discussions.</i>
